Then remove your finger from the straw. What happens? While your finger covers top of the straw, the liquid remains in the straw. When you remove the finger, the water flows out.

When you keep your finger on the straw, you are lessening the pressure of air over the straw. The greater pressure of air under the straw can hold the liquid inside the straw.

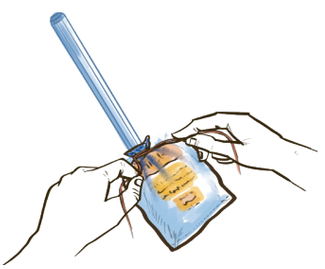

Let Us Do

Air Jack

Materials required: Empty plastic milk cover, a piece of thick string and an old pen body or pipe.

Procedure: Tie an old pen body or a pipe to the mouth of the milk cover with a string. Place 3 or 4 thin note books up on the plastic milk cover and slowly blow air into it with your mouth. As the cover gets inflated the books get raised. How does that work? The pressure that you exert with your mouth is limited. But the large area of the milk cover magnifies this pressure and lifts the books.

The above activity shows that _____.

1. Air rises up on getting warm
2. Air is needed for burning
3. Air has pressure

III. Breathing (Inhalation and Exhalation)

Let Us Do and Discuss

- Keep your finger near your nose and breathe. Do you feel air on your fingers?
- Try to count how many times you breathe in a minute.
- Now jump 6-7 times. Is your breathing rate the same or is it faster?
- Run 100 meters and stop. Observe your breathing.

All living things need air for their survival. Plants breathe through leaves and fish breathe through gills. Humans breathe in and breathe out through lungs.
