1.2 Diagonal

Diagonal is the line joining opposite corners of a geometrical shape.

Observe the corners of the square.

The line joining opposite corners of a square is called the **diagonal** of the square.

A square has two diagonals.

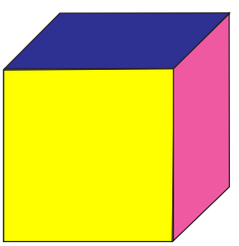

Diagonals of a cube:

A Cube has six square faces. Each square has two diagonals.

Diagonals in the faces = 6 × 2 = 12.

Diagonals in the inner sides of 4 corners = 4.

Total number of diagonals of a cube = 12 + 4 = 16.

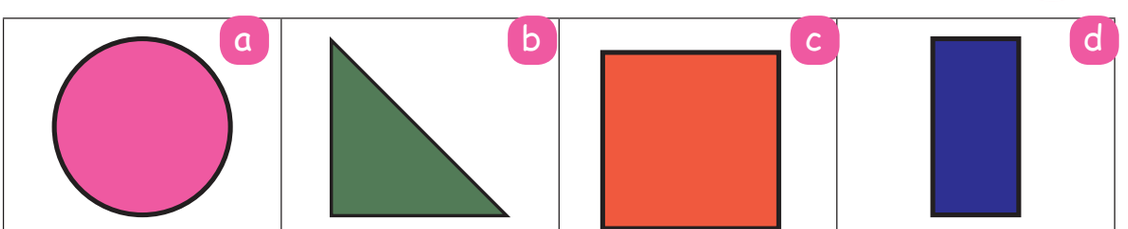

Draw the diagonals for the given rectangle.

How many diagonals will be there in a cuboid? _____.

Match the properties of 2D shapes by observing their sides and corners (vertices).

1. Opposite sides are equal. ( )
2. There are no sides and corners. ( )
3. Sides may or may not be equal. ( )
4. All the four sides are equal. ( )
