V. Food Chain

When you look around you can see the following.

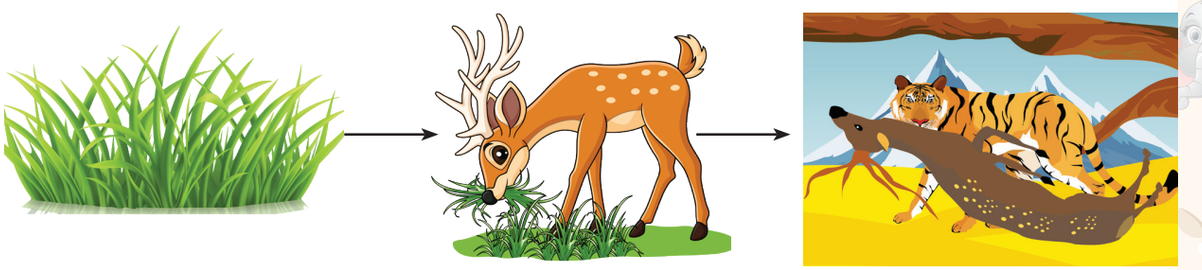

The grass is food for deer and deer is food for tiger.

Plants are food for grasshoppers and grasshoppers are food for bird.

From these examples, we observe that plants are food for many animals, which in turn become food for other animals.

G3P1W3

Let us look at the picture below:

Grass Deer Tiger

This is a food chain. It gives us information on how living things are related with one another by the food they eat. Here the grass is eaten by deer. The deer is eaten by the tiger.

A food chain usually starts with plants and ends with carnivores or omnivores.
