Now we break the following numbers, for example, 53 = 50 + 3, 98 = 90 + 8.

In 53, why should numbers to be parted into 50+3, because nearest multiples of 10 to 53 is 50 and add the remaining number 3 with it.

EXAMPLE 1

Complete the following multiplication facts by adding partial products.

$6 \times 45 = 6 \times (40+5)$

$= 6 \times 40 + 6 \times 5$

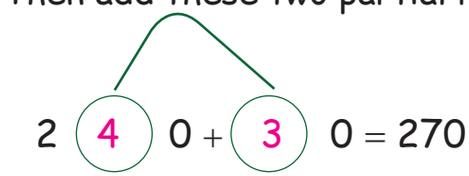

Break 45 into two parts $40 + 5$

Then multiply those two parts separately as:

$6 \times 40 = 240$

$6 \times 5 = 30$

Then add these two partial results.

$6 \times 45 = 270$

Exercise 2.7

Simplify the following multiplication facts by adding partial products.

1. 9×42 **2.** 3×78 **3.** 36×12 **4.** 18×19

5. 68×31 **6.** 42×21
